Background: What can be done to improve the quality of care delivered to consumers.

Objective: To measure the satisfaction of patients attending the OPD in a tertiary care hospital namely SKIMS, Soura.

Material and Methods: Pre-structured questionnaire was framed and data collected from patients attending the OPD. The data was later analyzed.

Settings: OPD section of SKIMS, Soura.

Results: 400 OPD patients were included in the study to know their perceptions towards the said hospital, reason for choosing the hospital, perception towards registration process, basic amenities & perception towards doctors and other staff. The major reason for choosing the health facility was skilled doctors. Majority of patients were satisfied with the facilities available as well as with the behavior of doctors and other health staff.

Conclusion: The health care delivered at this institute can be improved more and more once the organization, measures the delivery of quality of care on and ongoing basis and continually making small changes to improve the individual processes.

INTRODUCTION

Selecting the health care and measuring its quality is very complex and has remained elusive yet the tools of its measurement have increasingly improved. Many factors including poor systems and stress of the caregivers effects the quality along with satisfaction of pts. Patient satisfaction denotes the extent to which general health care needs of the clients are met to their requirements. Patients carry certain expectations before their visit and the resultant satisfaction or dissatisfaction is the outcome of their actual experience.^{1,2,3,4} Patient's perceptions about healthcare systems seem to have been largely ignored by health care managers in developing countries.^{4,5,6} This is despite the fact that patient satisfaction surveys are one of the established yardsticks to measure success of the service delivery system functional at hospitals. Also awareness about patient satisfaction is relevant in the sense that satisfied patients are more likely to abide by the treatment advised, to continue using medical services and to promote referrals, thereby increasing the service volumes. Health professionals are also benefited and

guided by the outcome of these surveys. The feedback received is likely to help them in identifying potential areas for service improvement.^{2,3,4} The present paper is based on a cross-sectional study conducted at tertiary care hospital SKIMS in the state of J&K to measure patient satisfaction who have availed services in OPD. OPD of SKIMS is one of the most sought among the various hospitals in Kashmir Valley. It caters to a patient population of roughly 5 lac annually, which amounts to an average OPD rush of about 1500 patients per day.

OBJECTIVE

To measure satisfaction of the patients attending the OPD.

MATERIAL AND METHODS

To carry out the proper scientific study, a set of well structured close-ended questionnaire was developed. The questionnaire was pre-tested. The questionnaire covered the information related to patients socio-economic characteristics, patient's choice of health facility,

registration process, perception towards availability of basic amenities, behavior of doctors and other staff, facilities available in pharmacy and dressing room. Data was collected with the help of interns posted at that time in the department of community medicine. They were duly trained for the data collection. The interns went to the OPD everyday and interacted with the patients, made them comfortable and interviewed them after they consulted the doctor. An informed verbal consent was taken from all the participating patients before start of the interview. The doctors and other staff was kept unaware to avoid any sort of bias. Data was collected for 2 months July and august 2010. Total of 400 patients were interviewed. After collecting the data, it was subjected to statistical analysis using the SPSS version 12.

DEFINITION

OPD In this study, OPD is defined as the hospital's department where patients received diagnosis and treatment but did not stay overnight.

OBSERVATIONS AND RESULTS

Regarding the general characteristics of the OPD patients (Table 1), 51% were males and 49%

Table 1. Characteristics of the OPD patients $n = 400/(\%)$		
Sex		
Male	204 (51)	
Female	196 (49)	
Age group (in years)		
0-15	1 (0.25)	
16-30	85 (21.25)	
31-50	233 (58.25)	
50 & above	81 (20.25)	
Education level		
Illiterate	159 (39.75)	
Middle pass	70 (17.5)	
Secondary	88 (24)	
High secondary	64 (16)	
Graduated and above	19 (4.75)	

were females. The majority of respondents (58%) were in age group of 31-50 years. 39% were illiterate. Skilled doctors was one of the most cited reasons (61%) for choosing the health facility by the OPD patients (Table 2). Main source of information regarding the hospital was family members while as mode of transportation for the majority of interviewed patients was bus/ auto (79%). 94% patients did not find any problem in locating the hospital or locating different departments within the hospital (70%). Regarding the registration 80% of OPD pts reported that registration counter was overcrowded however almost 63% (table 3) of patients were satisfied with behavior of registration clerk. Majority of pts were satisfied with the basic amenities (table 4). About 66% of pts reported that doctor's behavior as good and felt that doctor gave adequate time to them (77%). Regarding the perceptions of pts towards the paramedical staff majority of patients were satisfied with the behavior of lab technicians and other staff though 82% said services were not prompt.

DISCUSSION

Quality care is one of the central dimensions of public health. Good quality care needs to be delivered at the earliest and at the proper time which is a basic right of consumers. In recent years it has become clear that quality care can be measured easily. Quality care can be divided by measurement into Structure, Process and Outcome. Structure refers to basic infrastructure and the overall facility and Process means the way the care is delivered and Outcome points to final result. Health care must guarantee quality care along with safety which is pivotal to quality care.^{1,2,3,4} In this particular the study the most of the pts interviewed were satisfied with the services at this tertiary institute Skims, Srinagar India. This is consistant with many studies done elsewere.^{5,6,7,8} However the higher satisfaction must be attributed to Table 5. Perception of OPD patients towards doctors 400/(%) Behaviour of the doctor Good 267 (66.75) Satisfactory 125 (31.25) Poor 8 (2) Time taken by the doctor to attend the patient (in minutes) 5 - 1594 (23.5) 16 - 30 135 (33.75) 31 and above 171 (42.75) Whether patient perceives that time 136(34) given by the doctor is adequate Adequate 311 (77.75) Inadequate 89 (22.25)

SKIMS being a referral hospital, which receives pts who have often been shunted around between lower level facilities and attended by general practioners than by specialist. Aldana and his colleagues reported that the most powerful predictor for client satisfaction was the providers behavior towards pts. The behaviour of the doctors and paramedical staff in our study was found to be satisfactory but not good.^{7,8,9,10,11} Major client dissatisfaction was with waiting time greater than 30 mts which is similar to other studies.^{9,10,12} It was observed during the study that the ultimate satisfaction of a pt. is doctor. A pt. forgets the toll that takes him to reach the services if a doctor sees the pt. with compassion.

CONCLUSION & RECOMMENDATIONS

In present scenario where the hospital is recognized

as a social institute and pt is the only reason for its existence, the hospital must strive for pt oriented services. Assessing the overall scenario of OPD, it can be recommended that SKIMS needs to bring out some simple changes to improve pt satisfaction these include

- 1. Introducing simpler methods of registration.
- 2. Amenities like drinking water and clean toilets made available.
- 3. Adhering to strict time schedules by doctors and other staff.
- 4. Effort made to reduce pt overload so that doctors and other staff can give more attention and time to the pts. The same can be achieved by strengthening infrastructure and human resources at the peripheral health facilities
- 5. The overall quality of care can be improved more in aggregate by raising the level of performance of all providers rather than finding a few poor performers and punishing them, and continuously making small changes to improve their individual processes. This approach can be very powerful if embraced over a period of time.
